

nFlow Mobile

A complete digital dictation mobility suite

BlackBerry

A professional dictation application on a BlackBerry means this highly popular business device becomes an even more powerful productivity tool. Owners of devices running operating software 4.5 or later can dictate with nFlow Mobile on their BlackBerry, send it immediately for typing or store it for later use. Using the BlackBerry Enterprise Server or BlackBerry Internet Services dictations are routed automatically to the nFlow server.

Windows Mobile

Designed for Windows Mobile 5 & 6 this client application is simplicity itself. Large buttons for touch sensitive PDA screens or full use of the 'D' pad controls allows authors to dictate quickly and easily. They can store dictations for completion later or submit them for typing straight away. Using Activesync push technology dictations are sent back for automatic processing anywhere a data signal is available and routed straight to the nFlow server.

Web upload

Upload and profile dictations from anywhere the internet is available. Using the latest .Net technology the web upload has been designed with portable voice recorders in mind. Authors require nothing more than their USB cable to upload their dictations to the nFlow server for immediate processing. Whilst doing this they can add profile information such as date/time required, work type and a client matter reference. Fully compatible with the DSS format the web upload provides a truly remote way of getting dictations back for typing.

Email Gateway

To complement the web upload the email gateway provides an effortless and automatic method of submitting dictations for transcription. Designed to complement most download and email software supplied with portable dictation devices authors can attach an audio recording to an email and send it to the gateway where the author will be instantly identified and the audio routed to the appropriate secretary. Again full compatibility with the DSS standard makes this gateway functional with a wide range of recording devices.

iPhone

Efficient, remote working is enhanced via the iPhone and iPod Touch. Users can send digital dictation recordings to their offices, for integration into nFlow workflow with the click of a button. Administrators and resource managers can have complete visibility of workloads per client, allowing them to manage and assign tasks based on their level of urgency and importance.

And there's more

nFlow digital dictation software can also be supplied with options that support Citrix and Terminal Services remote access, VPN, and a fully functional telephone dictation interface optimised for mobile telephones.
